Problem Background:

E-commerce platforms generate massive amounts of user data, including ratings and textual reviews. While collaborative filtering (CF) uses rating data for recommendations, it often fails to capture the emotional and contextual information in user opinions. This leads to less accurate or generic suggestions, especially in sparse or cold-start scenarios. User reviews contain valuable sentiment cues that reflect true preferences. However, many recommender systems do not effectively utilize this data. There is a need for models that can extract and incorporate sentiment information to enhance recommendation quality. Combining CF with deep sentiment analysis models like MLA-EDTCNet offers a promising solution to this challenge.
solution to this change.
Problem Statement: Traditional collaborative filtering methods rely solely on user-item interactions and often struggle with sparsity and lack of contextual understanding. They ignore the rich sentiment information present in user reviews, which can reveal deeper preferences and opinions. Current recommendation systems lack effective integration of textual sentiment into their models. This gap limits their ability to provide truly personalized suggestions. There is a need for a hybrid approach that combines collaborative filtering with advanced sentiment analysis techniques to improve recommendation accuracy and relevance.

Aim of the Project:	
The aim of this project is to enhance the accuracy and personalization of e-comm	erce
recommendations by integrating sentiment analysis of user reviews using MLA–EDTCNet with traditional collaborative filtering techniques.	
ED TO Vet with traditional conaborative intering techniques.	
Objectives of the Project:	
1. To extract sentiment features from user reviews using MLA-EDTCNet.	
2. To integrate sentiment information with collaborative filtering models for persecommendations.	sonalized
3. To evaluate the effectiveness of the hybrid approach in improving recommend accuracy and user satisfaction.	dation
4. To compare the performance of the proposed model with traditional recomme methods.	ndation
mourous.	

Scopes of the Project:

- 1. The project focuses on e-commerce platforms with user reviews and ratings data.
- 2. It will integrate sentiment analysis using MLA-EDTCNet into collaborative filtering models.
- 3. The scope is limited to textual reviews in English (or another language if data allows).
- 4. The project evaluates the performance of the hybrid recommendation system in terms of accuracy and personalization.

	accuracy and personalization.
5.	It does not cover real-time recommendation updates or cross-platform integration.
Exp	pected Contribution of the Project:
6.	Enhanced Recommendation Accuracy: The hybrid model combining sentiment analysis
	with collaborative filtering is expected to improve the relevance and precision of
	recommendations.
7.	Novel Integration: By integrating MLA-EDTCNet with CF, this project introduces a
	novel approach to e-commerce recommender systems that leverages both structured
	and unstructured data.
8.	Improved Personalization: The use of sentiment features will enable more personalized
	recommendations, reflecting users' true preferences beyond just ratings.
9.	Benchmarking: The project provides a comparison between the proposed model and
	traditional recommendation methods, contributing to the body of knowledge on hybrid
	recommender systems.
