Project Proposal Form MCST1043 Sem: 2 Session: 2024/25

SECTION A: Project Information.

Program Name:	Masters of Science (Data Science)
Subject Name:	Project 1 (MCST1043)
Student Name:	SOH JOEN SHIUAN
Metric Number:	MCS241028
Student Email & Phone:	sohjoenshiuan@graduate.utm.my
Project Title:	Customer Churn Prediction in E-Commerce Industry using Classification Approach
Supervisor 1: Supervisor 2 / Industry Advisor(if any):	
SECTION B: Project	et Proposal
Introduction: In the fast-paced growing e	nvironment, retail sales transform business model into online sales to speed up
transaction procedure to ke	ep up with the digital trend. According to Ikhlass Boukrouh (2025), this is known as
electronic commerce (e-cor	nmerce) in which business transactions are conducted on the internet. This transformation
brings general challenges su	ich as high competition between e-commerce platforms, high return and refund rate from
customers. This leads to cu	stomer churn and the trend keeps growing. Based on the statistics from Jack M. Germain
(2023), the 42% if B2C con	npanies are churning 3% or more, followed by another 16% that churns 4% or more.
Customer churn happens w	when customer has decided to stop using the service. This reduces the brand loyalty, increasing
future customer acquisition	cost and revenue down, leading to business loss. (Daniyal Asif, 2025)
Churn prediction requires s	upervised learning method to train. The Traditional ML Models under supervised learning
method include Logistic Re	gression, Decision Trees, Random Forest, Gradient Boosting (XGBoost, LightGBM,
CatBoost), Support Vector	Machines (SVM), and k-Nearest Neighbours (k-NN). Random Forest algorithm would be
used to identify the patterns	s in customer churn. Following the pattern would reveal the root cause that affects the
customer churn rate in e-co	ommerce platform.

Problem Background:

Churn prediction allows the e-commerce management to identify whether the customers are likely to stop using the e-
commerce platform or not, allowing for preventive intervention. Without addressing customer churn, e-commerce has
higher tendency to lose the current customers, leading to lesser commission from transaction between customers and
sellers. At the same time, it would be increasing future customer acquisition costs through marketing, advertisements,
and promotions. Therefore, conducting research is necessary to reveal reasons that caused customers lose interest in
future engagement on the platform.
Problem Statement: E-commerce Customer daily active time has been gradually reducing. Reducing active time indicates that the customer
might be leaving the e-commerce platform in the future. The number of customers would be reducing gradually, leading
to lesser transactions to be made in the e-commerce platform. The seller would be directly influenced followed by the e-
commerce platform. Seller unable to sell the products to the customer. E-commerce platform would gain lesser
commission from overall transactions. By increasing e-commerce customer active time, customer would have higher
tendency to make more transactions in e-commerce platform. This requires customer daily active period data, total time
spent on the platform, purchase history data to train a model that predicts the tendency of customer churn.
For the current solution, management predict the users that is frequently active in the platform would be purchasing
more items. In the fact that customer is active but without purchasing items. This gives a contradiction point that
customer active time does not directly influence the number of customer transactions.
Aim of the Project: To develop and enhance a predictive model that uses Random Forest algorithm that labels the customer as churn or
not churn, provide actionable insights in improving the sales revenue and customer active time.
Objectives of the Project:
To preprocess the data by applying one-hot encoding technique on existing dataset.
2) To develop a predictive model that able to predict the customers that is going to churn
3) To evaluate the model accuracy on predicting the churn status of customer

Scopes of the Project: 1) Data source would be obtained from public datasets such as Kaggle. 2) Python would be used to process and clean the Excel file data. 3) MySQL would be used to translate the data into summarized form. 4) SQL would be used to translate the data from database. Expected Contribution of the Project: Current method would use manual check to identify whether the customer is churn or not. The moment to identify whether the customer is churn or not. The moment to identify whether the customer is churn or not, the customer already churn. With the use of predictive model, marketing able to find out a list of customers that has sign to stop using the platform early. Marketing able to implement early prevention strategies such as free shipping/discount vouchers, lucky draw contest to keep these customers from leaving the platform. E-commerce revenue would be increasing in proportion to increased transaction. Project Requirements: Software: Visual Studio Code, Python, SQL, Excel, MySQL, Power BI Hardware: Windows 11 Pc, 16 GB RAM, 500 GB Memory Technology/Technique/ Random Forest Algorithm Methodology/Algorithm: Type of Project (Focusing on Data Science): [/ Data Preparation and Modeling						
1) Data source would be obtained from public datasets such as Kaggle. 2) Python would be used to process and clean the Excel file data. 3) MySQL would be used to store data. 4) SQL would be used to translate the data into summarized form. 5) Power BI would be used to visualize the data from database. Expected Contribution of the Project: Current method would use manual check to identify whether the customer is churn or not. The moment to identify whether the customer is churn or not, the customer already churn.
